

Discussion: Workplace health and safety

Subject: Measuring workplace health and safety performance of our main contractors

Proposed Title:

IDENTIFICATION AND IMPLEMENTATION OF PERFORMANCE INDICATORS FOR THE PERFORMANCE OF CONTRACTORS

Brief context

The results achieved both in terms of transport service and infrastructure have been possible thanks to the contribution and the strong collaboration of suppliers with professionalism and competence. Our contracts require that contractors involved in the production process possess the relevant technical and organisational requirements in the field of health and safety.

The need to work towards a common goal with all our suppliers concerning the culture of prevention, as an imperative and distinctive value with which to manage operating processes, requires us to start measuring, in line with best practices, health and safety performance at work.

Proposal

In the first phase, we will measure the number and severity of workplace accidents of our main suppliers' personnel, in terms of size and duration of contracts, operating at our facilities.

Timeline

By August 2017, the definition of:

- the primary accident performance indicators;
- the methods and reliability of data collection;
- the contractor parameters to be monitored.

Analysis will involve a comparison with best practices of other industrial groups and the scheduling of an internal comparison seminar for the relevant companies.

Further to the definition of the indicators, by November 2017, the following will be completed:

- the project requirements for the implementation of the accident information system to ensure data reliability and consistency;
- the company's plan to address the application of the primary indicators;
- the processing of the most immediate indicators.
